# Fimble

Google Maps KML files tutorial
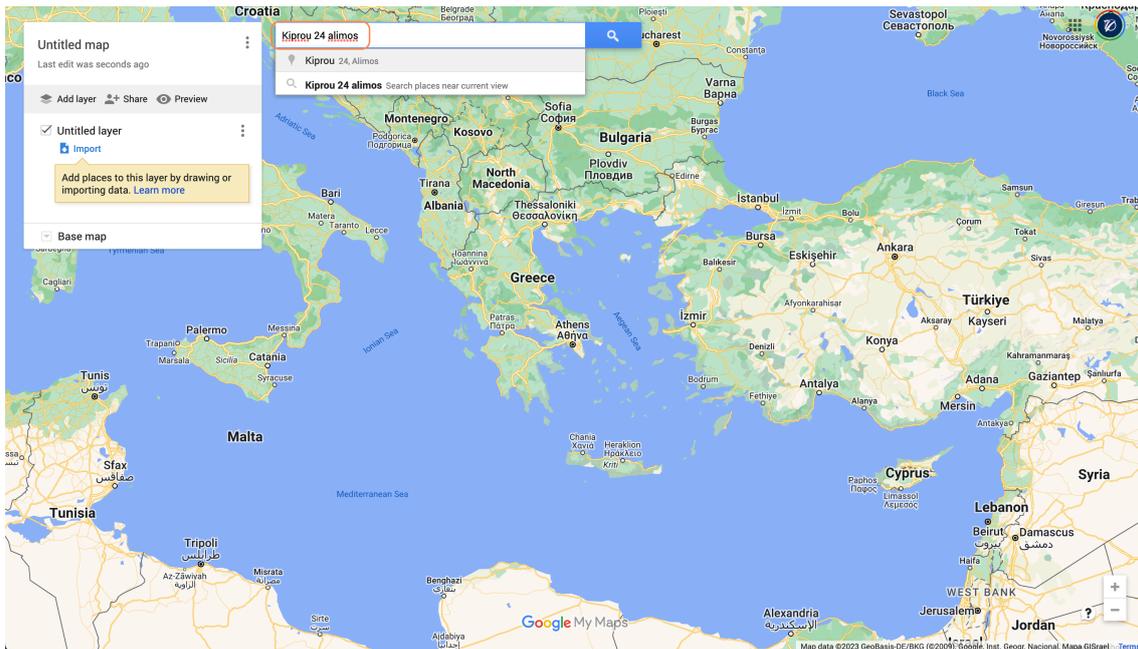

Create KML files

- You should first go to Google Maps using a Google account of yours, preferably a corporate one

- Hit the sidebar button and click on **Your Places**

- Select **Maps** and hit **Create Map** button

- System will open a new browser tab. Search the location / boundary you are interested in and select among the provided results

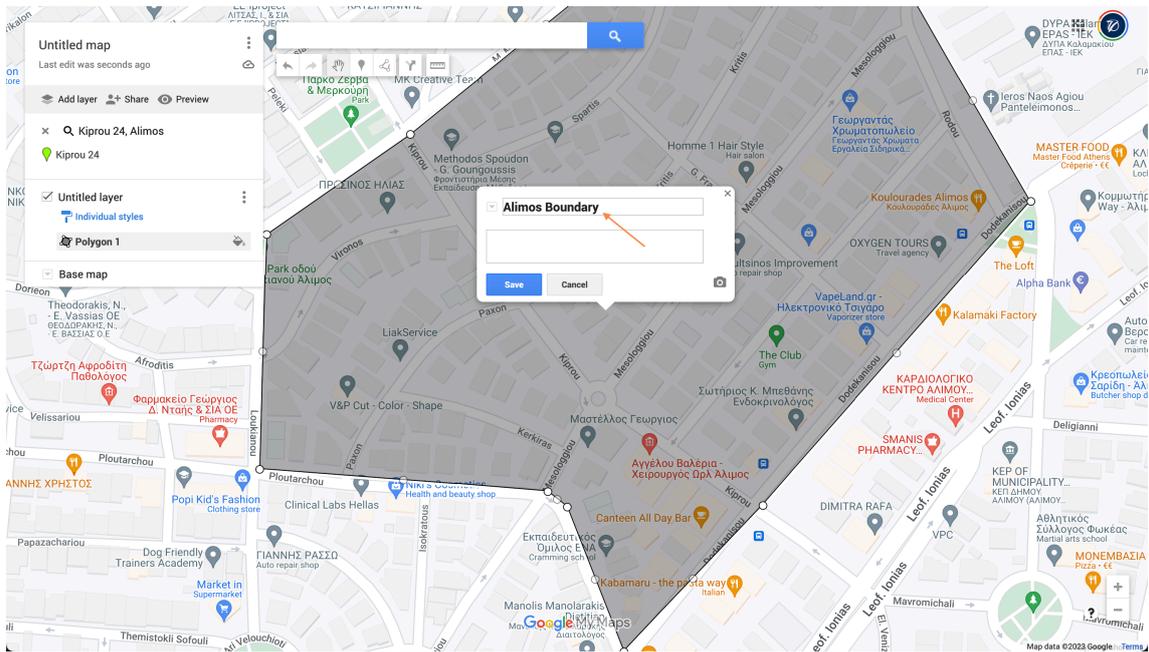

- Hit the highlighted button right below the search bar then select **Add line or shape**
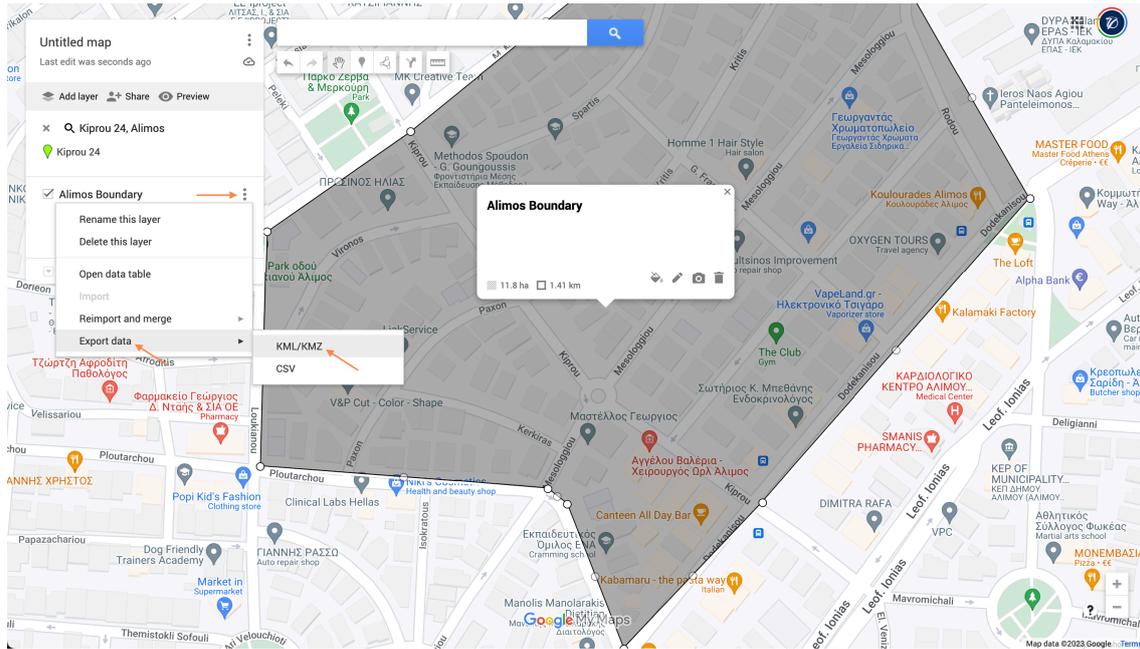

- Start defining the area you want to mark by clicking over the map

- After finishing the marking process, please give a name to your area

- Hit **Options** (3 dots) button right next to your boundary, go to **Export data** and select **KML/KMZ**

- Select **Export as KML instead of KMZ** then proceed to **Download**

After finishing the above process, send over the KML files to iProject in order to migrate to Fimble.
